Over the last decade, objective validated questionnaires measuring subjective perceptions have improved our understanding of erectile dysfunction treatment. We employed the Erectile Dysfunction Inventory of Treatment Satisfaction (EDITS) to assess fulfillment among Hispanic men who received a 3-piece Inflatable penile prosthesis (IPP).

- Average weighted EDITS patient satisfaction was 87% (interquartiles 72, 94).
- 143 (91%) found the device easy to use, continued to use it, and admitted use within the last month.
- Rate of confidence during intercourse was 94% and 82% described themselves as very confident.
- 57% perceived their erections as natural.
- 76% believed their partners were satisfied.

Hispanic men rate satisfaction with the IPP very high according to validated testing. The men use the device often, and most believe the erection is natural and their partners are satisfied.
